EXPERIMENT-9

PULKIT PANDEY

2K19/EP/076

Aim:- Perform code conversion: (a) Binary to Gray and (b) Gray to Binary.

Theory: A binary code represents text, computer processor instructions, or any other data using a two-symbol system. The two-symbol system used is often 0 and 1 from the binary number system. The reflected binary code, also known just as reflected binary or Gray code after Frank Gray, is an ordering of the binary numeral system such that two successive values differ in only one bit. For example, the representation of the decimal value "1" in binary would normally be "001" and "2" would be "010".

CIRCUIT DIAGRAMS: Binary to Gray Code

BINARY INPUT				GRAY CODE OUTPUT			
B3	B2	B1	B0	G3	G2	G1	G0
0	0	0	0	0	0	0	0
0	0	0	1	0	0	0	1
0	0	1	0	0	0	1	1
0	0	1	1	0	0	1	0
0	1	0	0	0	1	1	0
0	1	0	1	0	1	1	1
